

Hardy-Weinberg Principle Examples

A population has only 2 alleles, R and r , for a particular gene. The allele frequency for R is 30%. What are the frequencies of RR , Rr , and rr in the population?

$$p + q = 1 \quad p^2 + 2pq + q^2 = 1$$

Known: $R = 30\%$
 R represented by p
 $\therefore p = 30\%$ or 0.3

Solve for genotypic frequencies

$$RR(p^2) = (0.3)^2 \\ = 0.09$$

$$Rr(2pq) = 2(0.3)(0.7) \\ = 0.42$$

$$rr(q^2) = (0.7)^2 \\ = 0.49$$

Check

$$\begin{array}{r} 0.09 \\ + 0.42 \\ \hline 0.49 \\ \checkmark \end{array}$$

$$R = 0.3$$

$$r = 0.7$$

$$RR = 0.09$$

$$Rr = 0.42$$

$$rr = 0.49$$

find q : $p + q = 1$
 $0.3 + q = 1 - 0.3$
 $q = 0.7$

In a population of 200 mice, 8 have short tails, which is a recessive trait. The rest have long tails. Determine the frequencies of the genotypes and of the dominant and recessive alleles.

T = long tailed
 t = short tailed

$$p + q = 1 \quad p^2 + 2pq + q^2 = 1$$

Known: $tt = \frac{8}{200}$
 $= 0.04$

tt is q^2

find q :

$$q^2 = 0.04$$

$$q = \sqrt{0.04}$$

$$= 0.2$$

Solve for genotypic frequencies

$$TT(p^2) = (0.8)^2 \\ = 0.64$$

$$Tt(2pq) = 2(0.8)(0.2) \\ = 0.32$$

$$tt(q^2) = 0.04$$

Check

$$\begin{array}{r} TT = 0.64 \\ Tt = 0.32 \\ \hline tt = 0.04 \\ \checkmark \end{array}$$

$$T = 0.8$$

$$t = 0.2$$

$$TT = 0.64$$

$$Tt = 0.32$$

$$tt = 0.04$$

find p :

$$p + q = 1$$

$$p + 0.2 = 1$$

$$p = 1 - 0.2$$

$$p = 0.8$$
